

1. Give example scenarios that it is better to use adaptive window over sliding window for anomaly detection. Justify your answer.
2. We used the following example to explain the step by step iLOF's measurements update. We included point 11 in *reachdist* update (Figure 1) but not in lrd update (Figure 2). Explain why, given  $k=2$ .

Figure 1: *reachdist* update

Figure 2: lrd update

**Solution:** We update lrd value of point  $p$  if

- The  $k$ -neighbourhood of the point  $p$  changes,
- *Reachdist* from point  $p$  to one of its  $k$ -neighbours changes.

3. In iLOF deleting a point  $p_i$  from the existing dataset always increases the  $k$ -distances of  $R_k$ -NN of  $p_i$ . Justify the reason.

See lecture 1.pdf.

4. In what case does MiLOF resembles to iLOF?

**Solution:** As the bucket/window size decreases, MiLOF begins to resemble iLOF, and in the limit (when there is no historical retention by bucket/window) MiLOF reduces to iLOF.

5. In the lecture we saw how we can derive SVDD's dual formulation from its primal formulation. Now given OCSVM's primal formulation as below, derive its dual formulation.

$$\min_{w, \xi, \rho} \frac{1}{2} \|w\|^2 + \frac{1}{vn} \sum_{i=1}^n \xi_i - \rho$$

$$\text{s.t.} \quad (w \cdot \phi(x_i)) \geq \rho - \xi_i, \forall i = 1, \dots, n$$

$$\xi_i \geq 0, \forall i = 1, \dots, n$$

**Solution:**

$$L(w, \rho, \xi, \alpha, \gamma) = \frac{1}{2} w^T w + \frac{1}{vn} \sum_{i=1}^n \xi_i - \rho - \sum_{i=1}^n \alpha_i (w^T \phi(x_i) + \rho + \xi_i) - \sum_{i=1}^n \gamma_i \xi_i$$

$$\begin{aligned} \frac{\partial L}{\partial w} &= w - \sum_{i=1}^n \alpha_i \phi(x_i) = 0 & w &= \sum_{i=1}^n \alpha_i \phi(x_i) \\ \frac{\partial L}{\partial \rho} &= -1 - \sum_{i=1}^n \alpha_i = 0 & \sum_{i=1}^n \alpha_i &= -1 \\ \frac{\partial L}{\partial \xi_i} &= \frac{1}{vn} - \alpha_i - \gamma_i = 0 & \frac{1}{vn} &= \alpha_i + \gamma_i \end{aligned}$$

$$\begin{aligned} L(w, \rho, \xi, \alpha, \gamma) &= \frac{1}{2} w^T w + \frac{1}{vn} \sum_{i=1}^n \xi_i - \rho - \sum_{i=1}^n \alpha_i w^T \phi(x_i) - \rho \sum_{i=1}^n \alpha_i - \sum_{i=1}^n \alpha_i \xi_i - \sum_{i=1}^n \gamma_i \xi_i \\ &= \frac{1}{2} w^T w + \frac{1}{vn} \sum_{i=1}^n \xi_i - \rho - \sum_{i=1}^n \alpha_i w^T \phi(x_i) - \rho \sum_{i=1}^n \alpha_i - \sum_{i=1}^n \alpha_i (\xi_i + \gamma_i) \\ &= \frac{1}{2} w^T w + \frac{1}{vn} \sum_{i=1}^n \xi_i - \rho - \sum_{i=1}^n \alpha_i w^T \phi(x_i) - \rho \sum_{i=1}^n \alpha_i - \frac{1}{vn} \sum_{i=1}^n \xi_i \\ &= \frac{1}{2} w^T w - \rho - \sum_{i=1}^n \alpha_i w^T \phi(x_i) - \rho \sum_{i=1}^n \alpha_i \\ &= \frac{1}{2} w^T w - \rho - w^T w - \rho \sum_{i=1}^n \alpha_i \\ &= -\frac{1}{2} w^T w - \rho - \rho \sum_{i=1}^n \alpha_i \end{aligned}$$

# 程序代写+CS编程辅导

$$\min_{\alpha} \sum_{i=1}^n \sum_{j=1}^n \alpha_i \alpha_j k(x_i, x_j)$$

$$0 \leq \alpha_i \leq \frac{1}{vn}, \quad \sum_{i=1}^n \alpha_i = 1$$

6. Use OneClassSVM to perform unsupervised outlier detection. Some useful parameters: <https://scikit-learn.org/stable/modules/generated/sklearn.svm.OneClassSVM.html>

7. You may use LIBSVM (<https://www.csie.ntu.edu.tw/~cjlin/libsvm/>) for the following exercises. The web page provides the necessary information for parameter tuning. Download the KDDCUP data set from the UCI Machine Learning Repository <https://archive.ics.uci.edu/ml/datasets/kdd+cup+1999+data>
- Use SVDD and OCSVM to identify the attacks.
  - How many data points are common among the identified anomalies using different methods?
