程序代写代做 CS编程辅导

- Receive signals from input neurons: x_1, x_2, \dots, x_n
- Weight signals according to strength between neurons:
 $w_1x_1, w_2x_2, \dots, w_nx_n$
- Add the input signals and bias: $w_1x_1 + w_2x_2 + \dots + w_nx_n + b = \sum_{i=1}^n w_i x_i + b$
- Emit an output signal: activation function f

WeChat: cstutorcs

inputs weights sum

non-linearity

Assignment Project Exam Help

Activation Function

QQ: 749389476

<https://tutorcs.com>

$$\text{output} = f\left(\sum_{i=1}^n w_i x_i + b\right)$$

Activation Functions

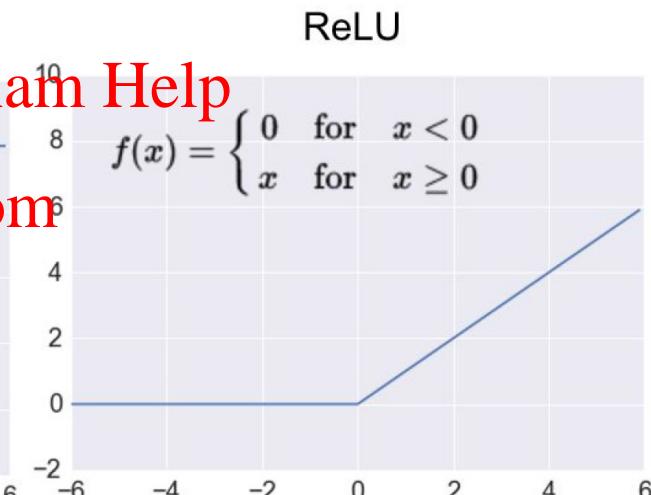

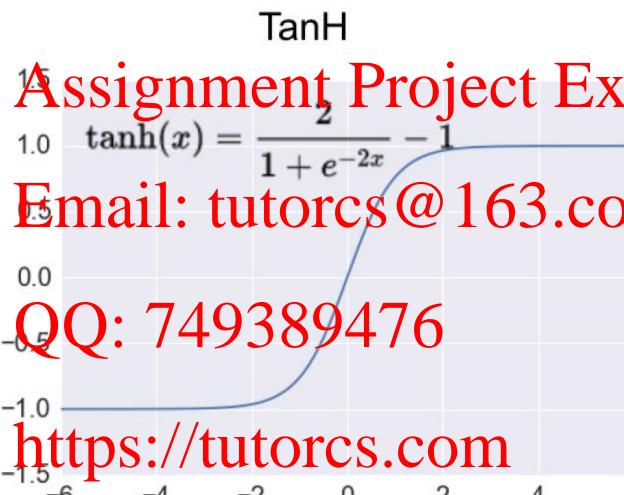

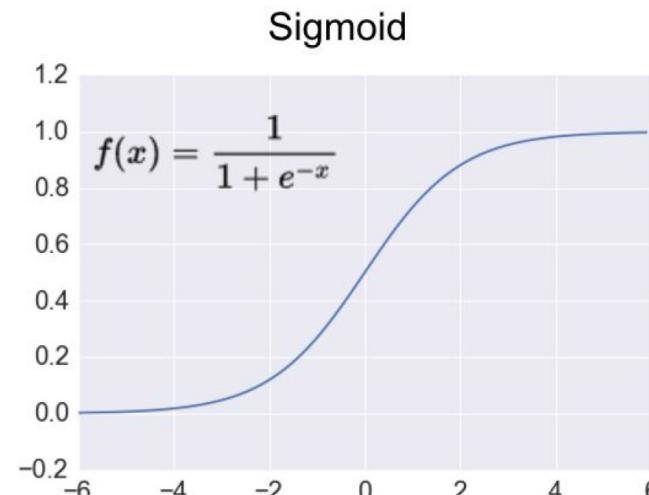

程序代写代做 CS编程辅导

- Activation functions add non-linearity to our network's function
- Most real-world problems  are non-linear

Common Activation Functions:

WeChat: cstutorcs

Assignment Project Exam Help

QQ: 749389476

<https://tutorcs.com>

Fundamentals of Neural Networks

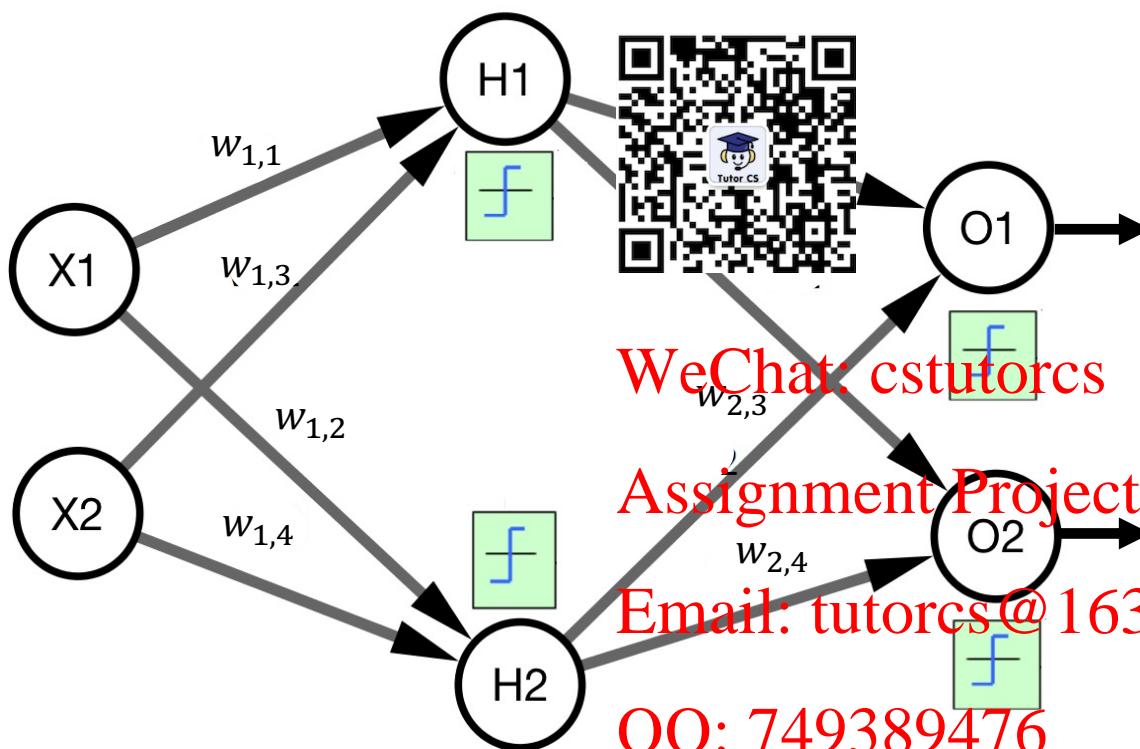

程序代写代做 CS编程辅导

$$output = \text{sigmoid}(2 \times 0.1 + 3 \times 0.5 + (-1) \times 2.5 + 5 \times 0.2 + 1 \times 3) = 0.96$$

Functional Form of Neural Networks

程序代写代做 CS编程辅导

WeChat: cstutorcs
Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Feed-Forward pass:

$$H_1 = f_1(X_1 w_{1,1} + X_2 w_{1,3})$$

$$H_2 = f_1(X_1 w_{1,2} + X_2 w_{1,4})$$

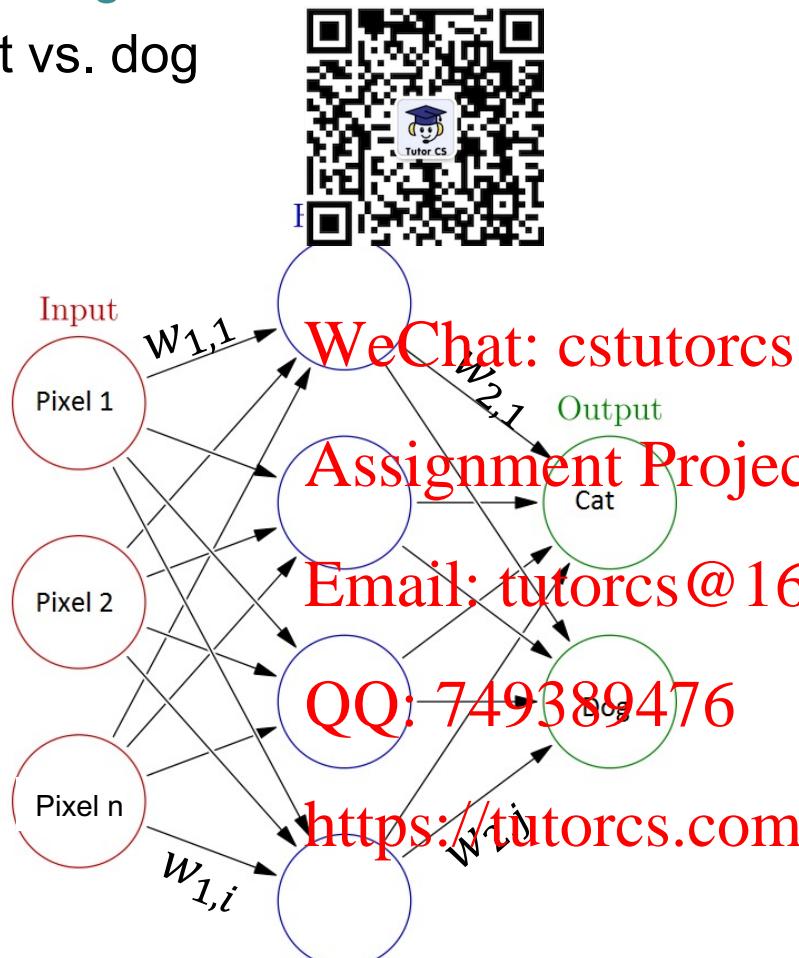

$$O_1 = f_2(H_1 w_{2,1} + H_2 w_{2,3})$$

$$O_2 = f_2(H_1 w_{2,2} + H_2 w_{2,4})$$

Training a Neural Network

程序代写代做 CS编程辅导

- Find a set of **weights** so that the network exhibits the desired behaviour
- Example: cat vs. dog

Output	Label
0.8, 0.7	1, 1 (Cat & dog)
0.08, 0.6	0, 1 (Dog)
0.92, 0.01	1, 0 (Cat)
0.02, 0.0	0, 0 (No cat or dog)

Error Function

程序代写代做 CS 编程辅导

- Measure the difference between actual output and expected output
- One popular measure: sum of squared error

$$E(input, weights, label) = \sum (output - label)^2$$

- Note: Neural network is a composite/nested function that map the input to the output.

Assignment Project Exam Help
 $output = f_{NN}(input, weights)$

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

- A training example is a vector of inputs and the desirable output(s), i.e., $(\{x_1, x_2, \dots, x_n\}, \{t_1, t_2, \dots, t_n\})$.  = 1 iff the data point $\{x_1, x_2, \dots, x_n\}$, belongs to class.
- **Objective:** finding the weights that minimise the difference between t and o (predicted output) for each of our training inputs.
- Define an error function E to be the sum of squared errors.

$$E = \frac{1}{2} \sum_{k=1}^n (o_k - t_k)^2$$

Assignment Project Exam Help

- If we think of E as height, it defines an error landscape on the weight space.
The aim is to find a set of weights for which E is very low.
- This is done by moving in the steepest downhill direction (Gradient descent), i.e., $-\frac{\partial E}{\partial w_i}$

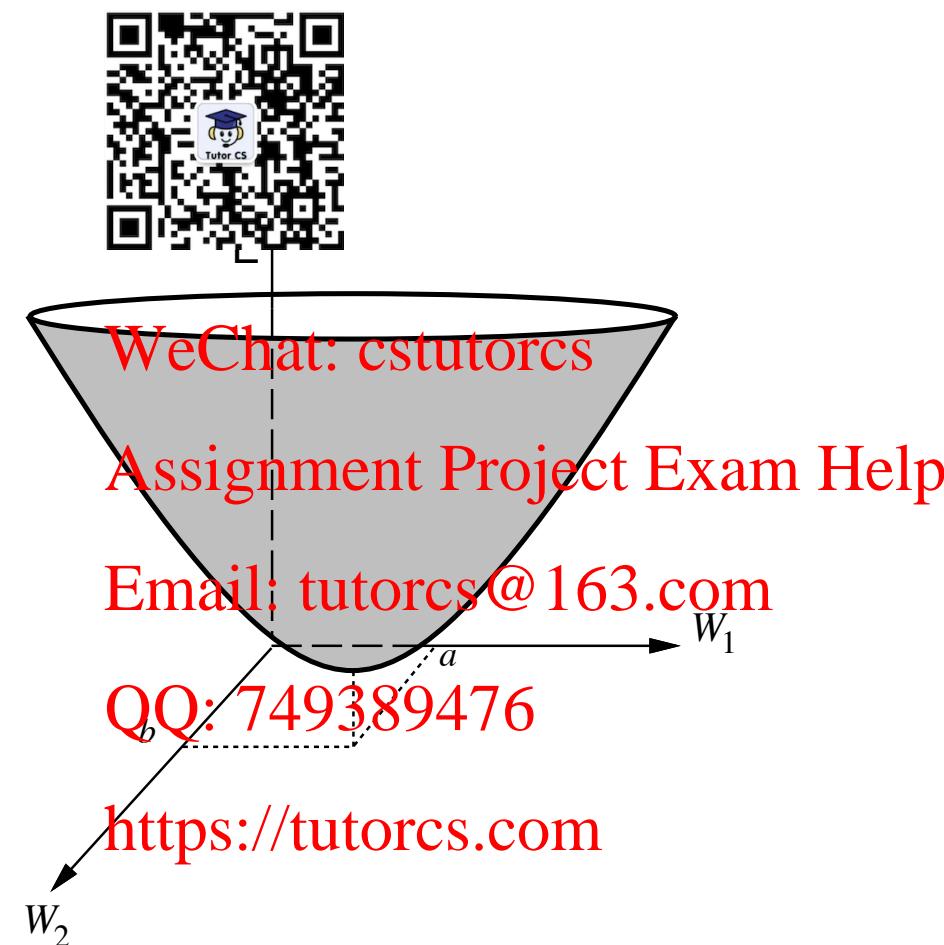

<https://tutorcs.com>

$$w_i \leftarrow w_i - \eta \frac{\partial E}{\partial w_i}$$

Weight update rule
 η : Learning rate

Example Error Landscape

- 程序代写代做 CS 编程辅导
- An example error landscape for gradient descent search in weight space

Intuition of Gradient Descent Learning

程序代写代做 CS编程辅导

$$w_1 = w_0 - \eta \frac{\partial E}{\partial w}(w_0)$$

$$w_2 = w_1 - \eta \frac{\partial E}{\partial w}(w_1)$$

Negative gradient points towards a local minimum.

Weight update rule

To derive the weight update rule, we need to remember the chain rule from differential calculus:

if $y = y(u)$ and $u = u(x)$

then $\frac{\partial y}{\partial x} = (\frac{\partial y}{\partial u})(\frac{\partial u}{\partial x})$

So, if $E = \frac{1}{2} \sum (o - t)^2$, $o = \sum w_i x_i + b$, and t = true output

$$\frac{\frac{\partial E}{\partial o}}{\frac{\partial o}{\partial w_i}} = \frac{\frac{1}{2} (o - t)^2}{\frac{\partial o}{\partial w_i}}$$

WeChat: [tutorcs](#)

$$= (o - t) \frac{\frac{\partial o}{\partial w_i}}{(o - t)x}$$

Assignment Project Exam Help

Email: tutorcs@163.com

Normally we include a learning rate parameter η to control the update of weights in a stable manner

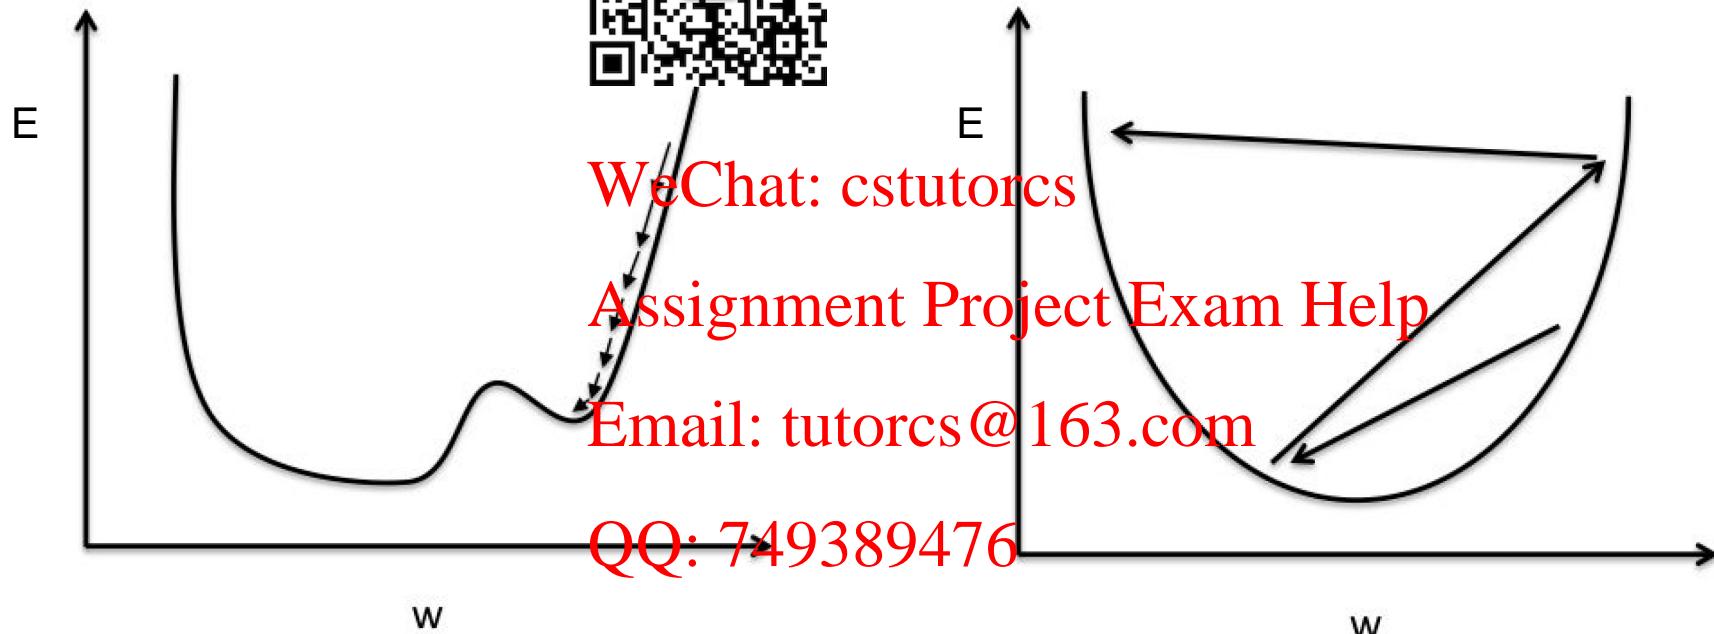

<https://tutorcs.com>

We repeatedly update the weights based on each example until the weights converge

Adjusting Learning Rate

程序代写代做 CS编程辅导

- Learning rate parameter η is a small value (usually $0.0001 - 0.1$) to control the update of weights in a stable manner.

Small learning rate: Many iterations until convergence and trapping in local minima.

Large learning rate: Overshooting.

- The iterative algorithm might converge to one of the many local minima

Backpropagation Algorithm

Backpropagation(network, training data D , label T)
程序代写代做CS编程辅导

Initialise the weights w to small random values

Repeat

For each $d \in D$, $d = \langle x_1, \dots, x_c \rangle$

Forward pass: calculate a_t and output O_j values

Backward pass:

WeChat: cstutorcs

Calculate error between o_k and t_k at output

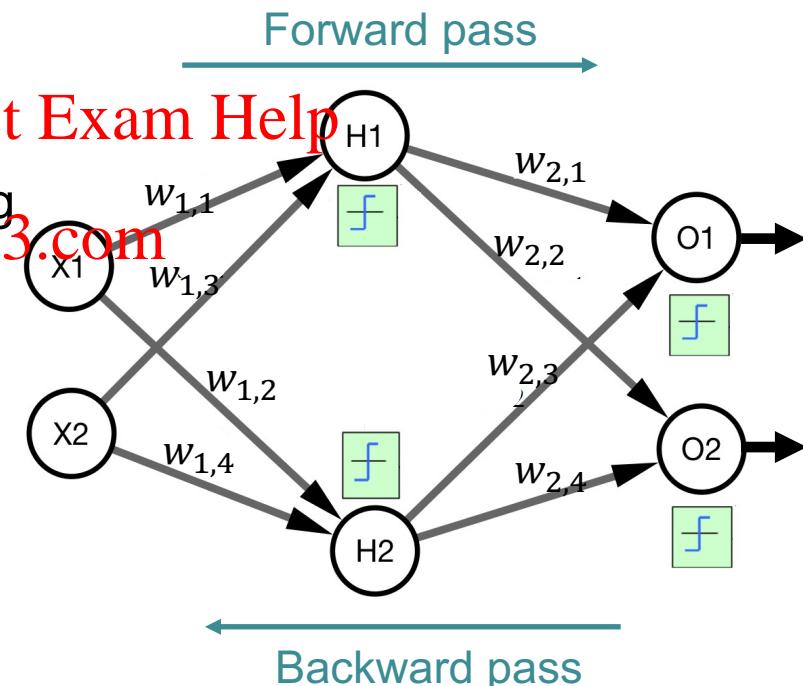

Assignment Project Exam Help

Update the weights in each layer $w_{i,j}$ (in proportion to their effect on the error using

Email: tutorcs@163.com
gradient descent $w_i \leftarrow w_i - \eta(o - t)x$)

Until network has converged QQ: 749389476

<https://tutorcs.com>

程序代写代做 CS编程辅导

- Number of input nodes = number of features
- Number of output nodes = number of classes
 - Neural networks can generally handle multi-class classification problems (compare 

- Number of hidden layers

- Number of nodes in each hidden layers

 Assignment Project Exam Help

- Learning rate

 Email: tutorcs@163.com

- Regularization parameters (similar to C in SVM): control the complexity of the model, preventing overfitting.

Autoencoder [1]

程序代写代做 CS 编程辅导

- A neural net which aim is to take an input $x \in \mathbb{R}^d$ and reproduce it $\hat{x} \in \mathbb{R}^d$.
- To make this non-trivial, we add a *bottleneck* layer $h \in \mathbb{R}^k$ whose dimension is much smaller than the input, $k \ll d$.
- Architecture:
 - Encoder: $h = f_\phi(x) = \text{sigmoid}(Wx + b)$
 - Decoder: $\hat{x} = g_\theta(h) = \text{sigmoid}(\hat{W}h + \hat{b})$
 - Often use tied weights, $\hat{W} = W^T$
- Minimize a loss function

$$\mathcal{L}(\theta, \phi) = \frac{1}{2} \sum_{i=1}^n (x_i - g_\theta(f_\phi(x_i)))^2$$
- Parameters are obtained using backpropagation
- Demo: <https://cs.stanford.edu/people/karpathy/convnetjs/demo/autoencoder.html>

Problem with AEs

程序代写代做 CS 编程辅导

- Their latent space and their encoded vectors, may not be continuous.

程序代写代做 CS 编程辅导

- VAEs are in a class of models called generative models, they can be used to generate examples of input by learning their statistics (e.g., mean and variance).
- Instead of learning $f_\phi(x)$, VAEs learn distributions of the features given the input, and the input given the activations, i.e., probabilistic versions of f_ϕ and g_θ . The VAE will learn:

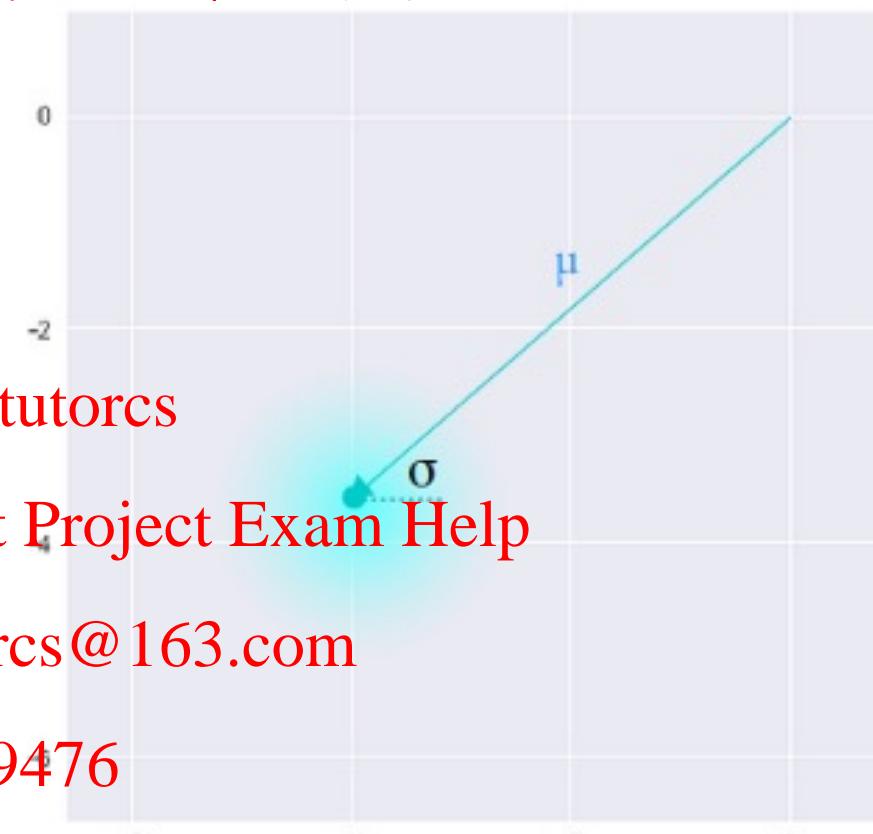

- $q_\phi(h|x)$: the distribution of the features given the input
- $p_\theta(x|h)$: the distribution of the input given the features.
- **Objective:** Find a distribution $q_\phi(h|x)$ of some latent variables h , which we can sample from $h \sim q_\phi(h|x)$, to generate new samples $\hat{x} \sim p_\theta(x|h)$.

Encoding of AE vs. VAE

程序代写代做 CS编程辅导

Standard Autoencoder
(direct encoding coordinates)

Variational Autoencoder
(μ and σ initialize a probability distribution)

<https://tutorcs.com>

程序代写代做 CS编程辅导

- Often times the data is noisy, and a model of the distribution of the data is more useful for a given application.
- The relationship between observed variables and the latent variables can be nonlinear, in which case the VAE provides a way to do inference.
- The VAE is a generative model; by learning $p_{\theta}(x|h)$, it is possible to sample h and then sample x . This enables the generation of data that has similar statistics to the input.

程序代写代做 CS编程辅导

$$\mathcal{L}(\theta, \phi) = \underbrace{\mathbb{E}_{q_\phi(h|x)} \underbrace{[x|h)] - D_{KL}(q_\phi(h|x) \| p_\theta(h))}_{\text{Regulariser (KL divergence)}}}_{\text{Reconstruction Loss}}$$

WeChat: cstutorcs

- **Reconstruction Loss:** The expected log-likelihood measures how well samples from $q_\phi(h|x)$ are able to explain the data x .
- **Regulariser:** Ensures that the explanation of the data $q_\phi(h|x)$ doesn't deviate too far from the prior distribution $p_\theta(h)$.
- **Kullback–Leibler (KL)-divergence:** Measure of difference between two distributions (the approximate posterior and the prior for h)

程序代写代做 CS 编程辅导

- Disentangle Representation: Each variable in the inferred latent representation h is only sensitive to one single generative factor and relatively invariant to other factors.
- Extract very useful features from a very high dimensional space and use them to a task it wants to learn.
- Those features *generalise* to domains outside the training data, and enhance *interpretability*.

程序代写代做 CS编程辅导

$$\mathcal{L}(\theta, \phi) = \mathbb{E}_{q_\phi(h|x)} [\log p_\theta(x|h)] - \beta D_{KL}(q_\phi(h|x) \| p_\theta(h))$$

- For $\beta > 1$, it applies a stronger constraint on the latent bottleneck and limits the representation capacity of h .

Assignment Project Exam Help

- Advantages:** Extremely flexible even if each conditional is simple (e.g. conditional Gaussian), the marginal likelihood can be arbitrarily complex

程序代写代做 CS编程辅导

- Training VAE: using only data of normal instances to learn $q_\phi(h|x)$ and $p_\theta(x|h)$

- For a test instance z

- Evaluate the mean and deviation vectors with the probabilistic encoder $(\mu_z, \sigma_z) = q_\phi(h|z)$

WeChat: cstutorcs

- Draw L samples from $h \sim N(\mu_z, \sigma_z)$

Assignment Project Exam Help

- Compute the reconstruction probability

Email: tutorcs@163.com

$$P_{recons}(z) = \frac{1}{L} \sum_{l=1}^L p_\theta(z|\mu_{\hat{z}_l}, \sigma_{\hat{z}_l})$$

QQ: 749389476

$$(\mu_{\hat{z}_l}, \sigma_{\hat{z}_l}) = q_\phi(x|h_l)$$

<https://tutorcs.com>

- z is anomaly if $P_{recons}(z) > \alpha$

- Latent variables are stochastic variables

- The probabilistic encoder of VAE models the distribution of the latent variables (rather than the variable itself).
- It can capture normal anomalies which share the same mean, but different variance.

- Reconstructions are stochastic variables

Assignment Project Exam Help

- Reconstruction probability considers the reconstruction error, as well as the variability of the reconstruction (by considering the variance parameter of the distribution function).

Email: tutors@163.com
QQ: 749389476

- This property enables selective sensitivity to reconstruction according to variable variance.
